1 Introduction and functional overview

This specification specifies the functionality, API and the configuration of the AUTOSAR Basic Software module "FlexRay State Manager".

In the AUTOSAR Layered Software Architecture, the FlexRay State Manager belongs to the Services Layer, or more precisely, to the Communication Services.

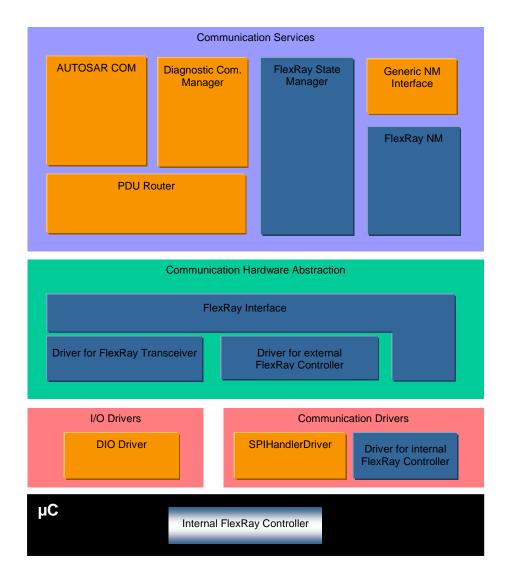

Figure 1 Software Architecture Overview

2 Acronyms and abbreviations

Acronym/ Abbrevation	Description:	
API	Application Program Interface

3.2 Related standards and norms

[13] FlexRay Communications System Protocol Specification Version 2.1 Rev A

3.3 Related specification

AUTOSAR provides a General Specification on Basic Software modules [12] (SWS BSW General), which is also valid for FlexRay State Manager.

Thus, the specification SWS BSW General shall be considered as additional and required specification for FlexRay State Manager.

4 Constraints and assumptions

4.1 Limitations

This specification only defines the straightforward case for starting and stopping the communication on a FlexRay cluster.

For the case of multiple <u>CC</u> of one ECU assigned to one FlexRay cluster some items are left open for the implementation:

- Which CC is used to transmit the wakeup pattern
- Handling of inconsistent POC states in the CCs

4.2 Applicability to car domains

The FlexRay Communication stack can be used wherever high data rates and fault tolerant communication (in conjunction with [11]) is required. Furthermore, it enables the synchronized operation of several ECUs within a car.

The FlexRay State Manager can be used for all domain applications which use the FlexRay Protocol.

5 Dependencies to other modules

5.1 AUTOSAR BSW Scheduler

The BSW Scheduler calls the main functions of the FrSM, which are necessary for the cyclic processes of the FrSM.

5.2 Communication Manager

The <u>ComM</u> requests network communication modes and is notified by the FrSM when a communication mode is reached.

5.3 AUTOSAR FlexRay Interface

The FrSM uses the API of the Frlf to initialize the FlexRay Communication Hardware and to control the operating modes of the FlexRay Controllers and FlexRay Transceivers assigned to the FlexRay Networks.

5.4 AUTOSAR Default Error Tracer

In order to be able to report development errors, the FlexRay State Manager has to have access to the error hook of the Default Error Tracer.

5.5 AUTOSAR Diagnostic Event Manager

In order to be able to report production errors the FlexRay State Manager has to have access to the Diagnostic Event Manager.

5.6 AUTOSAR BSW Mode Manager

In order to be able to report state changed the FlexRay State Manager has to have access to the BSW Mode Manager.

5.7 AUTOSAR FlexRay Network Management

In order to be able to report startup failures the FlexRay State Manager has to have access to the FlexRay Network Management.

5.8 File structure

5.8.1 Code file structure

For details refer to the chapter 5.1.6 "Code file structure" in SWS_BSWGeneral.

5.8.2 Header file structure

[SWS_FrSM_00139] [The header file FrSM.h shall include a software and specification version number. | ()

[SWS_FrSM_00140] [The FrSM module shall perform a consistency check between code files and header files based on pre-process-checking the version numbers of related code files and header files. | (SRS_BSW_00004)

6 Requirements traceability

Requirement	Description	Satisfied by
SRS_BSW_00004	All Basic SW Modules shall perform a pre- processor check of the versions of all imported include files	SWS_FrSM_00140
SRS_BSW_00005	Modules of the µC Abstraction Layer (MCAL) may not have hard coded horizontal interfaces	SWS_FrSM_00186
SRS_BSW_00101	The Basic Software Module shall be able to initialize variables and hardware in a separate initialization function	SWS_FrSM_00126
SRS_BSW_00159	All modules of the AUTOSAR Basic Software shall support a tool based configuration	SWS_FrSM_00064
SRS_BSW_00161	The AUTOSAR Basic Software shall provide a microcontroller abstraction layer which provides a standardized interface to higher software layers	SWS_FrSM_00186
SRS_BSW_00162	The AUTOSAR Basic Software shall provide a hardware abstraction layer	SWS_FrSM_00186
SRS_BSW_00164	The Implementation of interrupt service routines shall be done by the Operating System, complex drivers or modules	SWS_FrSM_00186
SRS_BSW_00167	All AUTOSAR Basic Software Modules shall provide configuration rules and constraints to enable plausibility checks	SWS_FrSM_00065
SRS_BSW_00168	SW components shall be tested by a function defined in a common API in the Basis-SW	SWS_FrSM_00186
SRS_BSW_00170	RS_BSW_00170 The AUTOSAR SW Components shall provide information about their dependency from faults, signal qualities, driver demands	
SRS_BSW_00314	All internal driver modules shall separate the interrupt frame definition from the service routine	SWS_FrSM_00186
SRS_BSW_00323	All AUTOSAR Basic Software Modules shall check passed API parameters for validity	SWS_FrSM_00018, SWS_FrSM_00028, SWS_FrSM_00168
SRS_BSW_00325	SRS_BSW_00325 The runtime of interrupt service routines and functions that are running in interrupt context shall be kept short	
SRS_BSW_00336	Basic SW module shall be able to shutdown	SWS_FrSM_00186
SRS_BSW_00347	A Naming seperation of different instances of BSW drivers shall be in place	SWS_FrSM_00186
SRS_BSW_00359	All AUTOSAR Basic Software Modules callback functions shall avoid return types	SWS_FrSM_00186

c p	AUTOSAR Basic Software Modules	SWS FrSM 00186
	callback functions are allowed to have parameters	
s	All AUTOSAR Basic Software Modules shall not return specific development error codes via the API	SWS_FrSM_00018, SWS_FrSM_00028, SWS_FrSM_00168
A b	The main processing function of each AUTOSAR Basic Software Module shall be named according the defined convention	SWS_FrSM_00118
	Basic Software Modules shall report wake- up reasons	SWS_FrSM_00186
	A Basic Software Module can return a nodule specific types	SWS_FrSM_00186
SRS_BSW_00381 -		SWS_FrSM_00013
	SSW Modules shall support multiple configuration sets	SWS_FrSM_00013
n V	A static status variable denoting if a BSW module is initialized shall be initialized with value 0 before any APIs of the BSW module is called	SWS_FrSM_00060, SWS_FrSM_00061, SWS_FrSM_00169, SWS_FrSM_00179
to	Each BSW module shall provide a function or read out the version information of a dedicated module implementation	SWS_FrSM_00029
	An index-based accessing of the nstances of BSW modules shall be done	SWS_FrSM_00186
fc	nterfaces which are provided exclusively or one module shall be separated into a dedicated header file	SWS_FrSM_00186
	The sequence of modules to be initialized shall be configurable	SWS_FrSM_00186
s	Software which is not part of the SW-C shall report error events only after the DEM is fully operational.	SWS_FrSM_00186
p	f a pre-compile time configuration parameter is implemented as "const" it should be placed into a separate c-file	SWS_FrSM_00186
	Pre-de-bouncing of error status nformation is done within the DEM	SWS_FrSM_00186
s	SSW modules with AUTOSAR interfaces shall be describable with the means of the SW-C Template	SWS_FrSM_00186
s	The BSW module description template shall provide means to model the defined rigger conditions of schedulable objects	SWS_FrSM_00186
d	SR functions shall be defined and documented in the BSW module description template	SWS_FrSM_00186
SRS_BSW_00428 A	A BSW module shall state if its main	SWS_FrSM_00186

Specification of FlexRay State Manager AUTOSAR CP R21-11

		,
	processing function(s) has to be executed in a specific order or sequence	
SRS_BSW_00429	Access to OS is restricted	SWS_FrSM_00186
SRS_BSW_00432	Modules should have separate main processing functions for read/receive and write/transmit data path	SWS_FrSM_00186
SRS_BSW_00437	Memory mapping shall provide the possibility to define RAM segments which are not to be initialized during startup	SWS_FrSM_00186
SRS_BSW_00438	Configuration data shall be defined in a structure	SWS_FrSM_00013, SWS_FrSM_00126, SWS_FrSM_00127, SWS_FrSM_00128
SRS_BSW_00439	Enable BSW modules to handle interrupts	SWS_FrSM_00186
SRS_BSW_00440	The callback function invocation by the BSW module shall follow the signature provided by RTE to invoke servers via Rte_Call API	SWS_FrSM_00186
SRS_BSW_00449	BSW Service APIs used by Autosar Application Software shall return a Std_ReturnType	SWS_FrSM_00186
SRS_BSW_00450	A Main function of a un-initialized module shall return immediately	SWS_FrSM_00181
SRS_ModeMgm_09081	The Communication Manager shall provide an API allowing collecting communication requests	SWS_FrSM_00020
SRS_ModeMgm_09084	The Communication Manager shall provide an API which allows application to query the current communication mode	SWS_FrSM_00024

7 Functional specification

7.1 Background & Rationale

FlexRay start-up is a complex process that is completely different from CAN. E.g. on CAN every message can wakeup the bus, on FlexRay a special wakeup pattern is needed. In order to make the FlexRay start-up process as reliable as possible, it has to be controlled by a BSW module with in-depth FlexRay knowledge. As the AUTOSAR Communication Manager has a completely abstracted bus view, it is the task of the FlexRay State Manager to map this abstracted view to the states of the FlexRay POC and to the CHI commands to change these states.

7.2 Main Task of the FlexRay State Manager

The main task of the FlexRay State Manager module can be summarized as follows:

The FlexRay State Manager module shall provide an abstract interface to the AUTOSAR Communication Manager module to startup or shutdown the communication on a FlexRay cluster.

The FlexRay State Manager module shall not directly access the FlexRay hardware (FlexRay Communication Controller and FlexRay Transceiver), but by means of the FlexRay Interface module.

The FlexRay Interface module redirects the request to the appropriate driver module.

7.3 State Machine of the FlexRay State Manager

7.3.1 General

[SWS_FrSM_00030] [The FlexRay State Manager shall implement one state machine for each FlexRay cluster.

The states of this state machine are to some extent derived from the <u>POC</u> states of the FlexRay <u>CC</u>. This document is based on the assumption that there is always a unique <u>POC</u> state for every FlexRay cluster (see Limitations in section 4.1).

The state machine of each cluster is processed by the main function FrSM_MainFunction_<FrSMCluster.ShortName> assigned to that cluster (see section 8.5.1). However, as defined in section 8.3.2, some transitions of the state machine are processed in the context of the FrSM_RequestComMode function in order to achieve a deterministic behavior for shutdown. | ()

7.3.2 States

[SWS_FrSM_00032] [The state machine shall comprise the following states:

FrSM Cluster State	Mapped FlexRay CC state	Description
FRSM_READY	POC:ready	
FRSM_WAKEUP	POC:wake-up	FrSM performs wake-up
FRSM_STARTUP	POC:start-up	FrSM performs startup
FRSM_HALT_REQ	POC:normal active	FrSM performs a
	or POC:normal passive	shutdown
FRSM_ONLINE	POC:normal active	Full Communication
FRSM_ONLINE_PASSIVE	POC:normal passive	Due to clock
		synchronization errors
		no data is transmitted
		or received.
FRSM_KEYSLOT_ONLY	POC:normal active	Data can only be
	$\land \underline{\text{vPOC!SlotMode}} \neq \text{AllSlots}$	transmitted in the key
		slots.
FRSM_LOW_NUMB-	POC:normal active	Full communication;
ER_OF_COLDSTARTERS		FlexRay is
		synchronized based on
		sync frames only.

]()

[SWS_FrSM_00176] [For controlling the passive mode (receive-only), the state machine shall additionally comprise the following states which concurrent to the states above:

Passive State	Description
FRSM_ECU_ACTIVE	When the FrSM is concurrently in state FRSM_READY, the transceivers are in set into mode
	FRTRCV_TRCVMODE_STANDBY, otherwise into mode
	FRTRCV_TRCVMODE_NORMAL
FRSM_ECU_PASSIVE	When the FrSM is concurrently in state FRSM READY, the transceivers are in set into mode
	FRTRCV_TRCVMODE_STANDBY, otherwise into mode FRTRCV_TRCVMODE_RECEIVEONLY.

1 ()

[SWS_FrSM_00180] [For reporting these two concurrent states to the BswM, a corresponding value of FrSM_BswM_StateType shall be determined as follows:

FrSM Cluster State	Passive State	FrSM_BswM_StateType <i>value</i>
FRSM READY	FRSM ECU ACTIVE	FRSM_READY
FRSM READY	FRSM ECU PASSIVE	FRSM_READY_ECU_PASSIVE
FRSM WAKEUP	FRSM ECU ACTIVE	FRSM_WAKEUP
FRSM WAKEUP	FRSM ECU PASSIVE	FRSM_WAKEUP_ECU_PASSIVE
FRSM STARTUP	FRSM ECU ACTIVE	FRSM_STARTUP
FRSM STARTUP	FRSM ECU PASSIVE	FRSM_STARTUP_ECU_PASSIVE
FRSM ONLINE	FRSM ECU ACTIVE	FRSM_ONLINE
FRSM ONLINE	FRSM ECU PASSIVE	FRSM_ONLINE_ECU_PASSIVE
FRSM ONLINE PASSIVE	FRSM ECU ACTIVE	FRSM_ONLINE_PASSIVE
FRSM ONLINE PASSIVE	FRSM ECU PASSIVE	FRSM_ONLINE_PASSIVE_ECU_PASSIVE
FRSM KEYSLOT ONLY	FRSM ECU ACTIVE	FRSM_KEYSLOT_ONLY
FRSM KEYSLOT ONLY	FRSM ECU PASSIVE	FRSM_KEYSLOT_ONLY_ECU_PASSIVE

FRSM HALT REQUEST	FRSM ECU ACTIVE	FRSM_HALT_REQUEST
FRSM HALT REQUEST	FRSM ECU PASSIVE	FRSM_HALT_REQUEST_ECU_PASSIVE
FRSM LOW NUMBER OF COLD-	FRSM ECU ACTIVE	FRSM_LOW_NUMBER_OF_COLDSTARTERS
<u>STARTERS</u>		
FRSM LOW NUMBER OF COLD-	FRSM ECU PASSIVE	FRSM_LOW_NUMBER_OF_COLD-
<u>STARTERS</u>		STARTERS_ECU_PASSIVE

]()

7.3.3 Variables

In addition to its state, the state machine description uses the following variables. Note that these variables are only auxiliary means for improving the clearness and the readability of the specification.

FrSM Variable	Туре	Description
reqComMode	ComM_Mod eType	The communication mode that has been requested by the ComM. The communication modes are abbreviated in this document as follows: NoCom: COMM_NO_COMMUNICATION SilentCom:COMM_SILENT_COMMUNICATION ON FullCom: COMM_FULL_COMMUNICATION According to the definition of ComM ModeType these modes are ordered as follows: NoCom < SilentCom < FullCom
startupCounter	Integer	The number of startup attempts that have been performed
wakeupType	Enum	The following values are supported: SingleChannelWakeup DualChannelWakeup DualChannelWakeupForward NoWakeup
wakeupTransmitted	Boolean	True if vPOC!WakeupStatus = FR_WAKEUP_TRANSMITTED for at least attempt to transmit a wakeup pattern, false otherwise
busTrafficDetected	Boolean	True if vPOC!WakeupStatus = FR_WAKEUP_RECEIVED_HEADER or FR_WAKEUP_RECEIVED_WUP for at least attempt to transmit a wakeup pattern, false otherwise
wakeupCounter	Integer	The number of attempts that have been performed for transmitting a wakeup pattern.

Note that the silent communication mode is not supported on FlexRay; it may not be requested by the ComM module.

7.3.4 State Machine Configuration

The state machine description uses the following configuration parameters that are defined in chapter 10.2 for each FlexRay cluster:

FrSM Configuration Parameter	Туре	Description
FrSMIsWakeupEcu	Boolean	See chapter 10.2
FrSMCheckWakeupReason	Boolean	See chapter 10.2
FrSMIsColdstartEcu	Boolean	See chapter 10.2
FrSMIsDualChannelNode	Boolean	This configuration parameter is
		derived from the Frlf
		configuration. If the
		corresponding Frlf cluster is
		connected to both channels of
		the FlexRay cluster, this
		parameter is TRUE. Otherwise,
5 0110 to 5 cities 147/114/14		it is FALSE.
FrSMStartupRepetitionsWithWakeup	Integer	The number of times an ECU
		may repeat the startup
		procedure including a wakeup
		for a FlexRay cluster.
		If this optional configuration
		parameter is missing, there shall be no limitation, i.e. the
		configuration parameter shall
		be treated as having the value
		∞
FrSMStartupRepetitions	Integer	Determines how often the ECU
Tromotartapropositions	iiiiogo.	can repeat the startup
		procedure by reinitializing the
		FlexRay <u>CC</u> , see chapter 10.2.
		This value must not be smaller
		than
		FrSMStartupRepetitionsWithW
		akeup.
		If this optional configuration
		parameter is missing, there
		shall be no limitation, i.e. the
		configuration parameter shall
		be treated as having the value
		∞
FrSMNumWakeupPatterns	Integer	Maximum number of Wakeup
		Patterns the node may send
		before going to
Fuch Apology Chowky and Alish as ANA - Leaves	Dooles	FRSM STARTUP.
FrSMDelayStartupWithoutWakeup	Boolean	If true, timer t1 shall be started
		instead of immediately calling
		Frlf_AllowColdstart in case of a
Frendhinhumber Of Caldata ta	Intogra	startup without wakeup.
FrSMMinNumberOfColdstarter	Integer	Minimum number of startup

frames that have to be present,
see chapter 10.2

7.3.5 Conditions

The state machine description uses the following conditions that are evaluated during runtime for each FlexRay cluster:

FrSM Condition	Туре	Description
WUReason	Enum	If FrSMCheckWakeupReason is false, WUReason evaluates to NO_WU_BY_BUS. Otherwise if FrSMCheckWakeupReason is true, determine the wakeup reason by calling FrIf_GetTransceiverWUReason for each transceiver of the FlexRay cluster and check for FRTRCV_WU_BY_BUS and evaluate WUReason to NO_WU_BY_BUS in case no wakeup has been detected. PARTIAL_WU_BY_BUS in case the ECU is connected to both FlexRay channels of the cluster and wakeup has been detected for exactly one channel ALL_WU_BY_BUS in case wakeup has been detected for all of the FlexRay channels of the cluster to which the ECU is connected.
t1_IsActive		Evaluates to true if t1 has been started and has not expired yet, otherwise to false
t3_IsNotActive	boolean	not expired, otherwise to true.
t_TrcvStdbyDelay_IsActive	boolean	Evaluates to true if tags TrcvStdbyDelay has been started and has not expired yet, otherwise to false.
wakeupFinished	boolean	Evaluates to false if the wakeup pattern transmission as defined in section 7.3.8 is still in progress, otherwise to true.
IowNumberOfColdstarters	boolean	= Frlf_GetNumOfStartupFrames() <

7.3.6 Timers

The state machine description uses the following timers for each FlexRay cluster:

Timer	Description			
t1	The timer t1 model	s the delay	of clearing	the coldstart

	inhibit mode (i.e. calling FrIf_AllowColdstart).
	The duration of this timer can be statically configured with
	the configuration parameter FrSMDurationT1.
t2	The timer t2 models the time difference after which the FrSM will repeat the startup of the FlexRay cluster.
	The duration of this timer can be statically configured with
	the configuration parameter FrSMDurationT2.
t3	The timer t3 supervises the transition to FullCom. The
	duration of this timer can be statically configured with the
	configuration parameter FrSMDurationT3.
t4	The timer t4 ensures that a dual channel node will
	eventually clear its coldstart inhibit bit and become a
	leading coldstarter.
t_TrcvStdbyDelay	The timer t_TrcvStdbyDelay models the time difference
	after which the FlexRay State Manager will reinitialize the
	FlexRay communication controllers and set the
	transceivers into STANDBY mode when FlexRay
	communication is stopped.

[SWS_FrSM_00142] [If the configuration parameter FrSMDurationT1 is set to 0, timer t1shall not be started. Instead, the call of FrIf_AllowColdstart shall immediately follow the call of FrIf_StartCommunication. | ()

[SWS_FrSM_00143] [If the duration FrSMDurationT2 of timer to 0, the startup of the FlexRay cluster shall not be supervised.

Note, that no assumption is made whether any of the timers is implemented in software or hardware.] ()

[SWS_FrSM_00209][If the configuration parameter FrSMTrcvStdbyDelay is not configured or set to 0, timer t_TrcvStdbyDelay shall not be started. Instead, the transition from state FRSM_HALT_REQ to FRSM_READY shall be executed immediately.] ()

7.3.7 Functional Elements

The functionality being performed in the transitions of the state machine is partitioned into the following functional elements. I.e. the following table contains abbreviations used as actions in the FrSM state machine description, which reference one or more function calls visible at the interfaces of the FrSM module.

Functional Element	Description
FE_WAKEUP	Call FrIf_SendWUP for each controller of the FlexRay cluster.
FE_SET_WU_CHANNEL_INITIAL	In case of a single channel node, do nothing. In case of a dual channel node, call Frlf_SetWakeupChannel for each controller of the FlexRay cluster in order to set the wakeup channel to the channel A.

EE OET MUL OUTSINE: EGETTE	
FE_SET_WU_CHANNEL_FORWARD	In case of a single channel node, do nothing.
	In case of a dual channel node, call
	Frlf_SetWakeupChannel for each controller of the
	FlexRay cluster in order to set the wakeup channel to
	the channel on which no wakeup has been detected
	while evaluating WUReason.
FE_CONFIG	Call FrIf_ControllerInit for each controller of the
	FlexRay cluster.
FE_START	Call FrIf_StartCommunication for each controller of
	the FlexRay cluster.
FE_ALLOW_COLDSTART	Call FrIf_AllowColdstart for each controller of the
	FlexRay cluster if the configuration parameter
	FrSMIsColdstartEcu is true.
FE_HALT	Call Frlf_HaltCommunication for each controller of
	the FlexRay cluster.
FE_TRCV_STANDBY	Call Frlf_SetTransceiverMode with Frlf_TrcvMode as
	FRTRCV_TRCVMODE_STANDBY for each
	transceiver of the FlexRay cluster.
FE_TRCV_NORMAL	In case the FrSM state machine is in state
	FRSM ECU ACTIVE, call Frlf_SetTransceiverMode
	with Frlf_TrcvMode as
	FRTRCV_TRCVMODE_NORMAL and
	Frlf_ClearTransceiverWakeup for each transceiver of
	the FlexRay cluster.
	In case the FrSM state machine is in state
	FRSM_ECU_PASSIVE, call
	Frlf_SetTransceiverMode with Frlf_TrcvMode as
	FRTRCV_TRCVMODE_RECEIVEONLY and
	Frlf_ClearTransceiverWakeup for each transceiver of
	the FlexRay cluster.
FE_START_FRIF	Set the Frif state to ONLINE by calling Frif_SetState
- =_0 . / /	with FrIf_StateTransition as FRIF_GOTO_ONLINE
	for the cluster.
FE_STOP_FRIF	Set the Frif state to OFFLINE by calling Frif_SetState
12_0101_1111	with FrIf_StateTransition as FRIF_GOTO_OFFLINE
	for the cluster.
FE_DEM_STATUS_FAILED	Report status of production error
T L_DEW_STATOS_TAILED	FRSM E CLUSTER STARTUP as failed.
FE DEM STATUS PASSED	Report status of production error
TE_DEW_STATOS_FASSED	FRSM_E_CLUSTER_STARTUP as passed.
FE_DEM_SYNC_LOSS	
FE_DEWLSTNC_LOSS	Report the status of the production error FRSM E CLUSTER SYNC LOSS as failed. If the
	name of an indication function (see section 8.6.3) is
	configured, call the indication function with the
FE DEM CVAIO LOGO BACOES	parameter SyncLossErrorStatus = true.
FE_DEM_SYNC_LOSS_PASSED	If the name of an indication function (see section
	8.6.3) is configured, call the indication function with
	the parameter SyncLossErrorStatus = false.
	Additionally report the status of the production error
	FRSM_E_CLUSTER_SYNC_LOSS as passed.
FE_FULL_COM_IND	Indicate to the ComM that FullCom has been
	reached by calling ComM_BusSM_ModeIndication
	(<u>FullCom</u>)

Specification of FlexRay State Manager AUTOSAR CP R21-11

FE_NO_COM_IND	Indicate to the <u>ComM</u> that <u>FullCom</u> has been left by calling ComM_BusSM_ModeIndication (<u>NoCom</u>).
FE_STARTUP_ERROR_IND	Call FrNm_StartupError.

7.3.8 Wakeup Pattern Transmission

[SWS_FrSM_00208][The FlexRay State Manager shall repeat the transmission of wakeup patterns according to the configuration parameter <u>FrSMNumWakeupPatterns</u>. I.e. the FlexRay State Manager shall perform the following actions while being in state FRSM_WAKEUP:

Set counter wakeupCounter to 1 when the state FRSM_WAKEUP is entered
While wakeupCounter FrSMNumWakeupPatterns and busTrafficDetected =
false:

- Wait until the FlexRay controllers of the FlexRay cluster are in state FR READY
- When the FlexRay controllers are in state FR_READY, check
 vPOC!WakeupStatus of the FlexRay controllers and act as follows:

vPOC!WakeupStatus	Actions
FR_WAKEUP_RECEIVED_HEADER,	<u>busTrafficDetected</u> := true
FR_WAKEUP_RECEIVED_WUP	
FR_WAKEUP_TRANSMITTED	wakeupTransmitted := true
FR_WAKEUP_UNDEFINED	wakeupTransmitted := false
FR_WAKEUP_COLLISION_HEADER	
FR_WAKEUP_COLLISION_WUP	
FR_WAKEUP_COLLISION_UNKNOWN	

- o If <u>busTrafficDetected</u> = false and wakeupCounter < <u>FrSMNumWakeup-</u> Patterns, execute FE_WAKEUP
- o Increment the wakeupCounter

If any of the FlexRay controllers enters the HALT state due to an error condition, the wakeup pattern transmission shall be aborted and the <u>wakeupFinished</u> condition shall evaluate to true.]()

7.3.9 Transitions

[SWS_FrSM_00093] [The following FrSM state machine diagram defines source state and the target state of the transitions, which are defined in detail in the table following this diagram.

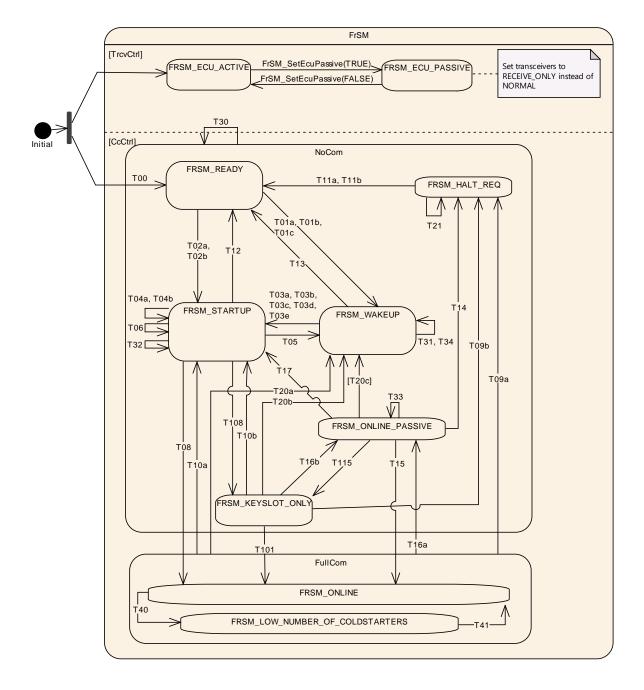

Figure 2 FrSM state machine of the FlexRay State Manager

Note that the states are described in section 7.3.2.

The following table defines the events and conditions that trigger the transitions of FrSM state machine and the actions that are executed within the transitions. Each row of the table contains a requirement which should be interpreted as follows. If the FrSM module is in the source state of the transition in column "Transition" as defined in SWS_FrSM_00093 and when the condition in column "Event [Condition]" holds and if the event in column "Event [Condition]" occurs, then the actions in column "Actions" shall be executed and afterwards the FrSM module shall change its state to the target state of the transition in column "Transition" as defined in SWS_FrSM_00093.

In case different actions have to be performed in a transition T, there can be multiple rows in the table. The rows are denoted as T (a), T (b) etc. in this case. Note that the conditions ensure that only one of the possibilities matches. | ()

[SWS_FrSM_00145] [After every transition to a different state, the FrSM shall inform the BswM by calling BswM_FrSM_CurrentState. | ()

[SWS_FrSM_00105] [The FrSM shall execute the actions of the transition in the order that is defined in the following table.

Tran- sition	Event [Condition]	Actions
T00	FrSM Init()	<u>FE_CONFIG</u>
T01 (a)	[reqComMode = FullCom	FE TRCV NORMAL startupCounter := 1 wakeupType := SingleChannelWakeup wakeupTransmitted := false FE WAKEUP start t1 start t3

Legend: \land ANDstart t: start timer t \lor ORcancel t: stop timer t \lnot NOT[...] guard condition for transition:= assignmentt1 [...] t1 has expired

| ()

Note: If synchronization is lost after FullCom has been reached, the FrSM module will first try to bring the FlexRay CC to the startup state without allowing cold start. Rationale: The loss of synchronization may be a local problem of the ECU. Thus the ECU should first try to re-integrate without disturbing the cluster.

Note: If resynchronization cannot be achieved before <u>t2</u> expires (see <u>FrSm076</u> and <u>FrSm077</u>), the same wakeup and startup procedure as for the initial synchronization will be used.

Note: If the startup of a FlexRay cluster is not successful (i.e. timer <u>t2</u> expires), the FrSM module will repeat the startup procedure depending on the value of the counter <u>startupCounter</u>:

46 40 0 6 0 1 0

ii <u>startupCounter</u>	does	not	exceed	ıne	LI I	resnoia
FrSMStartupRepetition	sWithWakeup,	the	startup proce	edure will	be re	epeated
including the wakeup.	-					
If startupCounter exce	eds the thresho	old [FrSMStartupF	Repetitions\	//ith\	<u> Wakeup</u>
but does not exceed	the threshold	<u> </u>	rSMStartupRe	epetitions,	the	startup
procedure will be repea	ated without wal	keup).			•

Note: When the timer $\underline{t3}$ expires, the FrSM will report the production error FRSM E_CLUSTER_STARTUP.

Note: After timer <u>13</u> has expired, the FrSM will call FrNm_StartupError until either synchronisation has been achieved or <u>NoCom</u> is requested (see <u>FrSm160</u> and <u>FrSm161</u>).

Note: When the counter <u>startupCounter</u> exceeds the threshold <u>FrSMStartupRepetitions</u>, an ECU that has been configured as a coldstart node will stop performing coldstart attempts. However, if another ECU performs a coldstart, the ECU will join the coldstart.

Note: If no threshold <u>FrSMStartupRepetitions</u> has been configured, an ECU that has been configured as a coldstart node will not stop performing coldstart attempts until either synchronisation has been achieved or <u>NoCom</u> is requested.

Rationale: If the RX path of a FlexRay CC is faulty, an ECU performing a wakeup or coldstart could disturb the FlexRay communication as it will not be able to detect any collision. Thus, an unlimited number of coldstart attempts could lead to a continuous disturbance of the FlexRay communication.

[SWS_FrSM_00149] [When a call of a function of the FlexRay Interface API returns a failure (e.g. E_NOT_OK), the FrSM shall ignore this return value and continue with the transition. | ()

Rationale: When the FlexRay Interface returns E_NOT_OK in a production environment, a production error has been reported to DEM. This will usually trigger the reinitialization of the FlexRay stack.

7.4 Configuration description

The FlexRay State Manager configuration tool reads the ECU configuration description of the FlexRay Interface as the mapping of controllers to clusters is contained in the FlexRay Interface configuration description.

7.5 Error classification

Section 7.x "Error Handling" of the document "General Specification of Basic Software Modules" [12] describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

7.5.1 Development Errors

[SWS_FrSM_91001][

Type of error	Related error code	Error value
Invalid pointer in parameter list. In case of this error, the API service shall return immediately without any further action, beside reporting this development error.	FRSM_E_ PARAM_ POINTER	0x01
Invalid network handle parameter	FRSM_E_INV_ HANDLE	0x02
FrSM module was not initialized	FRSM_E_ UNINIT	0x03
Invalid communication mode requested	FRSM_E_INV_ MODE	0x04
Initialization failed	FRSM_INIT_ FAILED	0x05

]()

7.5.2 Runtime Errors

There are no runtime errors.

7.5.3 Transient Faults

There are no transient faults.

7.5.4 Production Errors

7.5.4.1 FRSM_E_CLUSTER_STARTUP

Error Name:	FRSM_E_C	FRSM_E_CLUSTER_STARTUP		
Short Description:	FlexRay clust	FlexRay cluster startup failure.		
Long Description:	FlexRay controller has not reached the state <i>normal active</i> within the configured time after FlexRay startup.			
Recommended DTC:	Assigned by DEM			
		FlexRay controller has not reached the state normal active within the time $\underline{13}$		
	FlexRay controller has reached the state normal active			

Secondary Parameters:	None
Time Required:	FrSMDurationT3
Monitor Frequency	Continuous
MIL illumniation:	Assigned by DEM

7.5.4.2 FRSM_E_CLUSTER_SYNC_LOSS

Error Name:	FRSM_E_CLUSTER_SYNC_LOSS		
Short Description:	FlexRay synchronization loss.		
Long Description:	FlexRay controller has lost synchronization after successful		
	startup.		
Recommended DTC:	Assigned by D	DEM	
	Fail	FlexRay controller has lost synchronization after it has reached state normal active.	
Detection Criteria:		FlexRay controller has reached the state normal active or the request for FlexRay communication has been released.	
Secondary Parameters:	None		
Time Required:	Depends on FlexRay configuration.		
Monitor Frequency	Continuous		
MIL illumniation:	Assigned by DEM		

7.5.5 Extended Production Errors

There are no extended production errors.

8 API specification

8.1 Imported types

In this chapter all types included from the following modules are listed:

	FRSM_LOW_NUMBER_OF_COLDSTARTERS	0x0E	
	FRSM_LOW_NUMBER_OF_COLDSTARTERS_ECU_PASSIVE	0x0F	
Description	This type defines the states that are reported to the BswM using BswM_FrSM_CurrentState.		
Available via	FrSm.h		

]()

8.3 Function definitions

This is a list of functions provided for upper layer modules.

8.3.1 FrSM_Init

[SWS_FrSM_00013][

Service Name	FrSm_Init		
Syntax	void FrSm_Init (const FrSM_ConfigType* FrSM_ConfigPtr)		
Service ID [hex]	0x01		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	FrSM_ConfigPtr	Pointer to a selected configuration structure	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description Initializes the F		y State Manager.	
Available via	FrSm.h		

I(SRS BSW 00405, SRS BSW 00381, SRS BSW 00438)

[SWS_FrSM_00126] [The <u>FrSM_Init</u> function shall initialize the state machines for all FlexRay clusters and set them into the state <u>FRSM_READY</u>, i.e. perform transition <u>T00</u>.] (SRS_BSW_00438, SRS_BSW_00101)

[SWS_FrSM_00127] [The <u>FrSM_Init</u> function shall internally store the configuration data address to enable subsequent API calls to access the configuration data.] (SRS_BSW_00438)

[SWS_FrSM_00128] [If development error detection is enabled (FrSMDevErrorDetect is ON), the <u>FrSM_Init</u> function shall remember internally the successful initialization for other API functions to check for proper module initialization.] (SRS_BSW_00438)

8.3.2 FrSM_RequestComMode

[SWS_FrSM_00020][

Service Name	FrSM_RequestComMode
--------------	---------------------

Syntax	Std_ReturnType FrSM_RequestComMode (NetworkHandleType NetworkHandle, ComM_ModeType ComM_Mode)			
Service ID [hex]	0x02			
Sync/Async	Asynchronous			
Reentrancy	Reentrant for o	Reentrant for different FlexRay clusters		
Parameters (in)	Network Handle	This parameter identifies the FlexRay cluster for which a communication mode is requested.		
	ComM_Mode	This parameter holds the requested communication mode.		
Parameters (inout)	None			
Parameters (out)	None			
Return value	Std_Return- Type			
Description	This API function is used by the ComM to startup or shutdown the communication on a FlexRay cluster.			
Available via	FrSm.h			

(SRS_ModeMgm_09081)

[SWS_FrSM_00021] [The <u>FrSM_RequestComMode</u> function shall store the requested communication mode.

The next activation of the <u>FrSM_MainFunction</u> will then process this request when processing the state machine of the corresponding cluster.

Note, that the state machine definition in section 7.2 refers to this stored request as reqComMode. J ()

[SWS_FrSM_00022] [If NoCom is requested after FullCom has been reached (i.e. when the FrSM state machine of the corresponding cluster is in state FRSM_ONLINE, FRSM_KEYSLOT_ONLY, FRSM_LOW_NUMBER_OF_COLD-STARTERS or FRSM_ONLINE_PASSIVE), the FrSM_RequestComMode function shall immediately process the corresponding transition of the state machine (see section 7.2).] ()

Rationale of <u>SWS FrSM 00022</u>: This shall ensure that the <u>NoCom</u> request will stop the participation of the ECU in the FlexRay communication at the end of the current FlexRay cycle.

[SWS_FrSM_00141] [If ComM_Mode has the value COMM_SILENT_COMMUNICATION, the FrSM shall not store the requested communication mode and return E_NOT_OK. In case development error detection is

enabled, the FrSM shall additionally raise the development error code FRSM E INV MODE. | ()

[SWS_FrSM_00018] [If development error detection is enabled and the parameter NetworkHandle has an invalid value, the <u>FrSM_RequestComMode</u> function shall raise the development error code <u>FRSM_E_INV_HANDLE</u> and the <u>FrSM_RequestComMode</u> function shall return E_NOT_OK.] (SRS_BSW_00369, SRS_BSW_00323)

[SWS_FrSM_00019] [If development error detection is enabled and the parameter ComM_Mode has an invalid value, the <u>FrSM_RequestComMode</u> function shall raise the development error code <u>FRSM_E_INV_MODE</u> and the <u>FrSM_RequestComMode</u> function shall return E_NOT_OK. | ()

[SWS_FrSM_00061] [If development error detection is enabled and the FrSM module has not been initialized using <u>FrSM_Init</u>, the <u>FrSM_RequestComMode</u> function shall raise the development error code <u>FRSM_E_UNINIT</u> and the function <u>FrSM_RequestComMode</u> shall return E_NOT_OK. | (SRS_BSW_00406)

8.3.3 FrSM_GetCurrentComMode

[SWS FrSM 00024][

Service Name	FrSM_GetCurrentComMode				
Syntax	Std_ReturnType FrSM_GetCurrentComMode (NetworkHandleType NetworkHandle, ComM_ModeType* ComM_ModePtr)				
Service ID [hex]	0x03				
Sync/Async	Synchronous				
Reentrancy	Reentrant for different FlexRay clusters				
Parameters (in)	Network Handle	Handle of communication network			
Parameters (inout)	None				
Parameters (out)	ComM_Mode Ptr				
Return value	Std_Return- Type E_OK: Request accepted E_NOT_OK: Request was not accepted as the FrSM has not been initialized using FrSM_Init.				
Description	This API function can be used to determine the current communication mode of a FlexRay cluster.				
Available via	FrSm.h				

[SWS_FrSM_00025] [The <u>FrSM_GetCurrentComMode</u> function shall write the current communication mode of the corresponding FlexRay cluster into the given memory location. | ()

[SWS_FrSM_00026] [The <u>FrSM_GetCurrentComMode</u> function shall determine the communication mode as follows:

- ☐ If the FrSM state machine for the FlexRay cluster determined by NetworkHandle is in state <u>FRSM ONLINE</u> or <u>FRSM LOW NUMBER-OF COLDSTARTERS</u>, the communication mode is COMM_FULL_COMMUNICATION.
- ☐ In any other case, the communication mode is COMM_NO_COMMUNI-CATION.

]()

[SWS_FrSM_00027] [If development error detection is enabled and the parameter NetworkHandle has an invalid value, the FrSM_GetCurrentComMode function shall raise the development error code FRSM_E_INV_HANDLE and the FrSM_GetCurrentComMode function shall return E_NOT_OK.] ()

[SWS_FrSM_00028] [If development error detection is enabled and the parameter ComM_ModePtr equals NULL_PTR, the FrSM_GetCurrentComMode function shall raise the development error code FRSM_E_PARAM_POINTER and the FrSM_GetCurrentComMode function shall return E_NOT_OK. [(SRS_BSW_00369, SRS_BSW_00323)

[SWS_FrSM_00060] [If development error detection is enabled and the FrSM module has not been initialized using <u>FrSM_Init</u>, the <u>FrSM_GetCurrentComMode</u> function shall raise the development error code <u>FRSM_E_UNINIT</u> and the <u>FrSM_GetCurrentComMode</u> function shall return E_NOT_OK.] (SRS_BSW_00406)

8.3.4 FrSM_GetVersionInfo

[SWS_FrSM_00029][

Service Name	FrSM_GetVersionInfo		
Syntax	void FrSM_GetVersionInfo (Std_VersionInfoType* versioninfo)		
Service ID [hex]	0x04	0x04	
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	None		
Parameters (inout)	None		
Parameters	versioninfo Pointer to where to store the version information of this module.		

Specification of FlexRay State Manager AUTOSAR CP R21-11

(out)	
Return value	None
Description	This service returns the version information of this module. The version information includes: • Module Id • Vendor Id • Vendor specific version numbers (BSW00407). This function shall be pre compile time configurable On/Off by the configuration parameter: FRSM_VERSION_INFO_API Hint: If source code for caller and callee of this function is available this function should be realized as a macro. The macro should be defined in the modules header file.
Available via	FrSm.h

J(SRS_BSW_00407)

8.3.5 FrSM_AllSlots

[SWS_FrSM_00172][

Service Name	FrSm_AllSlots	FrSm_AllSlots		
Syntax	Std_ReturnType FrSm_AllSlots (NetworkHandleType NetworkHandle)			
Service ID [hex]	0x05			
Sync/Async	Asynchronous	Asynchronous		
Reentrancy	Reentrant for different FlexRay clusters			
Parameters (in)	Network This parameter identifies the FlexRay cluster for which a communication mode is requested.			
Parameters (inout)	None			
Parameters (out)	None			
Return value	Std_Return- Type			
Description	This API function can be used to leave the KeySlotOnlyMode.			
Available via	FrSm.h			

[SWS_FrSM_00197][The <u>FrSM_AllSlots</u> function shall be pre compile time configurable ON/OFF by the configuration parameter FrSMAllSlotsSupport I()

[SWS_FrSM_00171] [The <u>FrSM_AllSlots</u> function shall call Frlf_AllSlots for each controller of the FlexRay cluster. It shall return E_OK if each of these calls returned E_OK, otherwise FrSM_AllSlots shall return E_NOT_OK. | ()

[SWS_FrSM_00168] [If development error detection is enabled and the parameter NetworkHandle has an invalid value, the <u>FrSM_AllSlots</u> function shall raise the development error code FRSM_E_INV_HANDLE and the <u>FrSM_AllSlots</u> function shall return E_NOT_OK. | (SRS_BSW_00369, SRS_BSW_00323)

[SWS_FrSM_00169] [If development error detection is enabled and the FrSM module has not been initialized using FrSM_Init, the <u>FrSM_AllSlots</u> function shall raise the development error code FRSM_E_UNINIT and the <u>FrSM_AllSlots</u> function shall return E_NOT_OK. | (SRS_BSW_00406)

8.3.6 FrSM_SetEcuPassive

[SWS FrSM 00174][

Service Name		FrSm_SetEcuPassive		
Syntax	Std_ReturnType FrSm_SetEcuPassive (boolean FrSM_Passive)			
Service ID [hex]	0x06			
Sync/Async	Synchronous			
Reentrancy	Non Reentrant			
Parameters (in)	FrSM_ Passive	This parameter determines whether all FlexRay clusters are set to passive, i.e. receive only.		
Parameters (inout)	None			
Parameters (out)	None			
Return value	Std_Return- Type			
Description	This API function can be used to set all FlexRay clusters of the ECU to a receive only mode.			
Available via	FrSm.h			

|()

[SWS_FrSM_00177] [The <u>FrSM_SetEcuPassive</u> function shall set the state of all FrSM state machines to <u>FRSM_ECU_PASSIVE</u> if the parameter FrSM_Passive evaluates to true, otherwise it shall set the state of all FrSM state machines to <u>FRSM_ECU_ACTIVE.</u>] ()

[SWS_FrSM_00178] [If the state machine of a FlexRay cluster is not in state FRSM_READY (i.e. the transceivers of the FlexRay cluster are not in standby mode), the function shall execute FE_TRCV_NORMAL for this cluster.] () [SWS_FrSM_00179] [If development error detection is enabled and the FrSM module has not been initialized using FrSM_Init, the FrSM_SetEcuPassive function shall raise the development error code FRSM_E_UNINIT and the FrSM_SetEcuPassive function shall return E_NOT_OK.] (SRS_BSW_00406)

8.4 Call-back notifications

The FlexRay State Manager does not provide any call-back API services to other BSW modules.

8.5 Scheduled functions

These functions are directly called by Basic Software Scheduler. The following functions shall have no return value and no parameter. All functions shall be non reentrant.

8.5.1 FrSM_MainFunction_<FrSMCluster.ShortName>

[SWS_FrSM_00118][

Service Name	FrSM_MainFunction_ <frsmcluster.shortname></frsmcluster.shortname>
Syntax	<pre>void FrSM_MainFunction_<frsmcluster.shortname> (void)</frsmcluster.shortname></pre>
Service ID [hex]	0x80
Description	
Available via	SchM_FrSm.h

(SRS_BSW_00373)

[SWS_FrSM_00047] [The <u>FrSM_MainFunction</u> shall determine the <u>POC</u> status of all FlexRay <u>CC</u> that are connected to the corresponding FlexRay cluster.

This document is based on the assumption that there is always a unique <u>POC</u> state for every FlexRay cluster (see Limitations in section 4.1). | ()

[SWS_FrSM_00192] [If the optional configuration parameter FrSMMinNumberOfColdstarter is configured, the <u>FrSM_MainFunction</u> shall determine the number startup frames by calling FrIf_GetNumOfStartupFrames.] ()

[SWS_FrSM_00048] [After determining the <u>POC</u> status and optionally the number of startup frames, the <u>FrSM_MainFunction</u> shall process the state machine of the corresponding cluster. | ()

Note: The <u>FrSM MainFunction</u> shall be called cyclically with a cycle time that is shorter than or equal to the FlexRay cycle duration.

Rationale: The <u>FrSM MainFunction</u> should be called at least once per FlexRay cycle. As the <u>POC</u> status only changes once per cycle, multiple invocations per FlexRay cycle have no benefit.

Note: After <u>FullCom</u> has been reached, the invocation of the <u>FrSM_MainFunction</u> can optionally be synchronized to the FlexRay global time to ensure that the <u>FrSM_MainFunction</u> is activated once per FlexRay cycle. However, this is outside of the scope of this specification.

Note: In case of very short FlexRay cycle times the <u>FrSM_MainFunction</u> can optionally be called with a cycle time that is larger than the FlexRay cycle time. However, this is outside of the scope of this specification as it can lead to increased startup time and to undetected <u>POC</u> status changes.

[SWS_FrSM_00181] [If the FrSM module has not been initialized using <u>FrSM_Init</u>, the <u>FrSM_MainFunction</u> function shall shall return immediately without performing any functionality and without raising any errors. | (SRS_BSW_00450)

8.6 Expected Interfaces

In this chapter all interfaces required from other modules are listed.

8.6.1 Mandatory Interfaces

This chapter defines all interfaces which are required to fulfill the core functionality of the module.

[SWS_FrSM_00096][

API Function	Header File	Description
BswM_FrSM CurrentState	BswM_Fr SM.h	Function called by FrSM to indicate its current state.
ComM_BusSM ModeIndication	ComM.h	Indication of the actual bus mode by the corresponding Bus State Manager. ComM shall propagate the indicated state to the users with means of the RTE and BswM.
FrIf_AllowColdstart	Frlf.h	Wraps the FlexRay Driver API function Fr_AllowColdstart().
Frlf_Clear- TransceiverWakeup	Frlf.h	Wraps the FlexRay Transceiver Driver API function FrTrcv_Clear TransceiverWakeup(). The enum value "FR_CHANNEL_AB" shall not be used.
Frlf_ControllerInit	Frlf.h	Initialized a FlexRay CC.
Frlf_GetPOCStatus	Frlf.h	Wraps the FlexRay Driver API function Fr_GetPOCStatus().
Frlf_GetTransceiver- WUReason	Frlf.h	Wraps the FlexRay Transceiver Driver API function FrTrcv_Get TransceiverWUReason(). The enum value "FR_CHANNEL_AB"

		shall not be used.
Frlf_Halt- Communication	Frlf.h	Wraps the FlexRay Driver API function Fr_HaltCommunication().
Frlf_SendWUP	Frlf.h	Wraps the FlexRay Driver API function Fr_SendWUP().
Frlf_SetState	Frlf.h	Requests FrIf state machine transition.
Frlf_SetTransceiver- Mode	Frlf.h	Wraps the FlexRay Transceiver Driver API function FrTrcv_Set TransceiverMode(). The enum value "FR_CHANNEL_AB" shall not be used.
Frlf_Start- Communication	Frlf.h	Wraps the FlexRay Driver API function Fr_StartCommunication().

]()

8.6.2 Optional Interfaces

This chapter defines all interfaces, which are required to fulfill an optional functionality of the module.

[SWS_FrSM_00097][

API Function	Header File	Description
Dem_Set- EventStatus	Dem.h	Called by SW-Cs or BSW modules to report monitor status information to the Dem. BSW modules calling Dem_SetEventStatus can safely ignore the return value. This API will be available only if ({Dem/DemConfigSet/DemEventParameter/DemEventReportingType} == STANDARD_REPORTING)
Det_Report- Error	Det.h	Service to report development errors.
FrIf_AllSlots	Frlf.h	Wraps the FlexRay Driver API function Fr_AllSlots
Frlf_GetNum- OfStartup- Frames	Frlf.h	Wraps the FlexRay Driver API function Fr_GetNumOfStartupFrames and gets a list of the current number of startup frames seen on the cluster. See variable vStartupPairs of [12] for details.
Frlf_Get- WakeupRx- Status	Frlf.h	Wraps the FlexRay Driver API function Fr_GetWakeupRxStatus and gets the wakeup received information from the FlexRay controller.
Frlf_Set- Wakeup- Channel	Frlf.h	Wraps the FlexRay Driver API function Fr_SetWakeupChannel(). The enum value "FR_CHANNEL_AB" shall not be used.
FrNm StartupError	FrNm.h	This function is called by the FrSM when synchronization of the FlexRay cluster could not be achieved.

8.6.3 Configurable Interfaces

8.6.3.1 <Cdd>_SyncLossErrorIndication

[SWS_FrSM_00190][

[SWS_FISIVI	_00130]		
Service Name	<cdd>_Syncl</cdd>	<cdd>_SyncLossErrorIndication</cdd>	
Syntax	NetworkHan	void <cdd>_SyncLossErrorIndication (NetworkHandleType NetworkHandle, boolean SyncLossErrorStatus)</cdd>	
Sync/Async	Synchronous		
Reentrancy	Reentrant for	different FlexRay clusters	
	Network Handle	Handle of FlexRay cluster	
Parameters (in)	SyncLoss ErrorStatus	true: ECU lost synchronization to the FlexRay cluster. false: ECU can synchronize to the FlexRay cluster or request for full communication has been released after the ECU lost its synchronization to the Flex Ray cluster.	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	This function is called with parameter SyncLossErrorStatus = true when the ECU loses its synchronization to the FlexRay cluster. The function is called with parameter SyncLossErrorStatus = false either when the ECU can synchronize to the FlexRay cluster or when the request for full communication has been released after the ECU lost its synchronization to the FlexRay cluster.		
Available via	FrSm_Externa	FrSm_Externals.h	

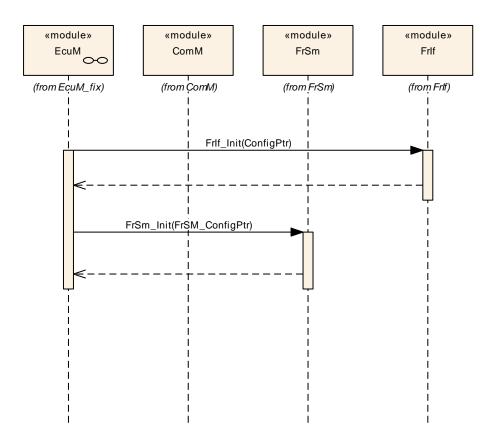

]()

The name of this function can be configured using the configuration parameter FrMmSyncLossErrorIndicationName (see chapter 10). The FlexRay State Manager will call this function when the ECU looses its synchronization to the FlexRay cluster, after it could synchronize to the FlexRay cluster or when the FullCom request is released after the ECU lost its synchronization to the FlexRay cluster.

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals.

Chapter 10.2 specifies the structure (containers) and the parameters of the module FlexRay State Manager.

Chapter 10.3 specifies published information of the module FlexRay State Manager.

10.1 How to read this chapter

For details refer to the chapter 10.1 "Introduction to configuration specification" in SWS_BSWGeneral.

10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters are described Chapters 0 and Chapter 8.

[SWS_FrSM_00064] [The <u>FrSM</u> module shall support tool based configuration.] (SRS_BSW_00159)

[SWS_FrSM_00065] [The configuration tool shall check the consistency of the configuration parameters at system configuration time.] (SRS_BSW_00167)

10.2.1 FrSM

SWS Item	ECUC_FrSM_00174:
Module Name	FrSM
Module Description	Configuration of the FlexRay State Manager
Post-Build Variant Support	true
Supported Config Variants	VARIANT-LINK-TIME, VARIANT-POST-BUILD, VARIANT-PRE-COMPILE

Included Containers		
Container Name	Multiplicity	Scope / Dependency
FrSMConfig	1 1	This container comprises the cluster specific configuration of the FlexRay State Manager.
FrSMGeneral	1 1	This container contains the general configuration parameters of the FlexRay State Manager.

Scope / Dependency	scope: local			

SWS Item	ECUC_FrSM_00170:			
Name	FrSMTrcvStdbyDelay			
Parent Container	FrSMCluster			
Description	The duration of timer t_TrcvStdbyDelay in seconds. The granularity of this parameter shall be restricted to full FlexRay cycles (FrlfGdCycle). A value of 0 shall imply that the timer is not used.			
Multiplicity	01			
Туре	EcucFloatParamDef			
Range	[0 INF]			
Default value				
Post-Build Variant Multiplicity	true			
Post-Build Variant Value	true			
Multiplicity Configuration	Pre-compile time	Χ	VARIANT-PRE-COMPILE	
Class	Link time	Χ	VARIANT-LINK-TIME	
	Post-build time	Χ	VARIANT-POST-BUILD	
Value Configuration Class	Pre-compile time	Χ	VARIANT-PRE-COMPILE

Scope / Dependency	scope: local dependency: FrSmMainFunctionCycleTime			

SWS Item	ECUC_FrSM_00070:			
Name	FrSMComMNetworkHandleRef			
Parent Container	FrSMCluster			
Description	Reference to the unique handle to identify one certain FlexRay network correspond to one of the network handles of the ComM configuration.			
Multiplicity	1			
Туре	Symbolic name reference to [ComMChannel]			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	VARIANT-PRE-COMPILE	
	Link time	Х	VARIANT-LINK-TIME, VARIANT-POST- BUILD	
	Post-build time			
Scope / Dependency	scope: local		_	

SWS Item	ECUC_FrSM_00116:
Name	FrSMFrlfClusterRef
Parent Container	FrSMCluster
	References the cluster configuration in the FlexRay Interface configuration. Note that the assigned controllers and transceivers are defined in the Frlf configuration and can be accessed via this reference.
Multiplicity	1

Specification of FlexRay State Manager AUTOSAR CP R21-11

Туре	Symbolic name reference to [FrlfCluster]		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time X VARIANT-PRE-COMPILE		
	Link time		VARIANT-LINK-TIME, VARIANT-POST- BUILD
	Post-build time		
Scope / Dependency	scope: local		

Included Containers				
Container Name	Multiplicity	Scope / Dependency		
FrSMClusterDemEventParameterRef s	01	Container for the references to DemEventParameter elements which shall be invoked using the API Dem_SetEventStatus in case the corresponding error occurs. The EventId is taken from the referenced DemEventParameter's DemEventId symbolic value. The standardized errors are provided in this container and can be extended by vendor-specific error references.		

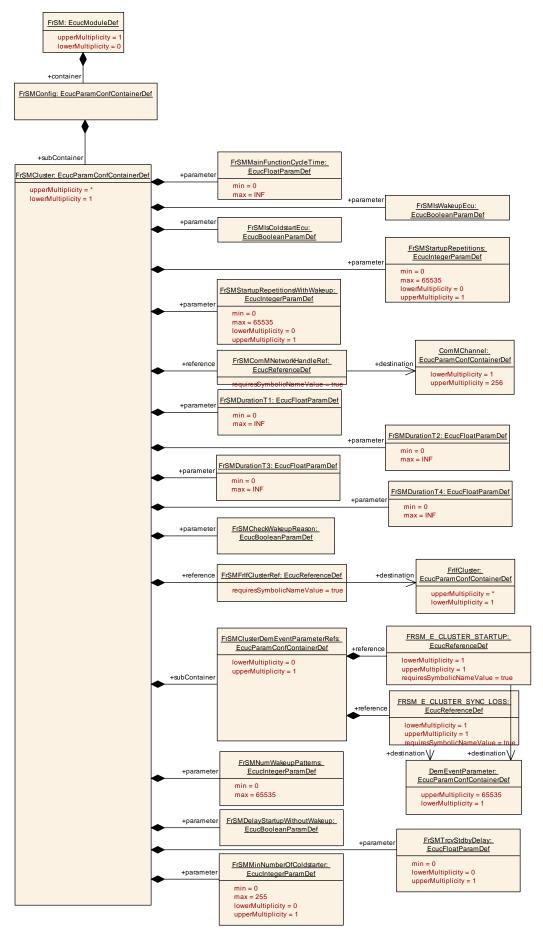

Figure 9 FrSMCluster Container

10.2.5 FrSMClusterDemEventParameterRefs

SWS Item	ECUC_FrSM_00163:			
Container Name	FrSMClusterDemEventParameterRefs			
Parent Container	FrSMCluster			
Description	Container for the references to DemEventParameter elements which shall be invoked using the API Dem_SetEventStatus in case the corresponding error occurs. The EventId is taken from the referenced DemEventParameter's DemEventId symbolic value. The standardized errors are provided in this container and can be extended by vendor-specific error references.			
Configuration Parameters				

SWS Item	ECUC_FrSM_00164:			
Name	FRSM_E_CLUSTER_STARTUP			
Parent Container	FrSMClusterDemEventPara	meter	Refs	
Description	Reference to the DemEventParameter which shall be issued when the error "FRSM_E_CLUSTER_STARTUP" has occurred. If the reference is not configured the error shall be reported as DET error.			
Multiplicity	1			
Type	Symbolic name reference to [DemEventParameter]			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X VARIANT-PRE-COMPILE			
	Link time	Х	VARIANT-LINK-TIME, VARIANT-POST- BUILD	
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_FrSM_00169:			
Name	FRSM_E_CLUSTER_SYNC_LOSS			
Parent Container	FrSMClusterDemEventParar	meter	Refs	
Description	Reference to the DemEventParameter which shall be issued when the error "FRSM_E_CLUSTER_SYNC_LOSS" has occurred. If the reference is not configured the error shall be reported as DET error.			
Multiplicity	1			
Туре	Symbolic name reference to [DemEventParameter]			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	VARIANT-PRE-COMPILE	
	Link time	Х	VARIANT-LINK-TIME, VARIANT-POST- BUILD	
	Post-build time			
Scope / Dependency	scope: local
